

Huawei Investment & Holding Co., Ltd.

2025 ANNUAL REPORT

Building a Fully Connected,
Intelligent World

Who is Huawei?

Founded in 1987, Huawei is a leading global provider of information and communications technology (ICT) infrastructure and smart devices. We have approximately 213,000 employees and we operate in more than 170 countries and regions, serving more than 3 billion people around world. We are committed to bringing digital to every person, home and organization for a fully connected, intelligent world.

Continuing the journey to an intelligent world

Laying the groundwork for All Intelligence

In 2025, AI applications saw rapid adoption around the world, bringing new momentum to homes, enterprises, and our everyday lives. In networking, AI is also giving rise to intelligent connectivity, which has laid the groundwork for intelligent industries. Huawei has been diving deep into different industrial scenarios, combining technologies like AI, networks, cloud, and computing to drive a targeted shift from isolated efficiency gains to systematic value creation across core business operations.

Moving forward, we will continue to bolster the foundations for an intelligent world, and build industry lighthouse projects – domain-specific showcases that light the way forward.

Strengthening innovation, openness, and collaboration

A surge of intelligence in all aspects of life and work will create strategic opportunities for innovation. Huawei believes in the power of an open approach to research and innovation, and we are working closely with industry partners and the academic community to advance technology and help different industries modernize. For the past three years, we have invested more than 20% of our annual sales revenue back into R&D to ensure the competitiveness of our products and solutions. We dive deep into our customers' unique challenges and goals, gaining an in-depth understanding of what end users truly need. With our strengths in systems engineering, we want to build more open and easier-to-use platforms, support a wide range of AI models and applications, and keep creating value for the industry as a whole.

Succeeding through quality, prioritizing security and trustworthiness

Quality is our lifeline – and our path to success. We are fully committed to building high-quality systems and capabilities, and driving up quality from one end of our business to the other, including the quality of our products, services, transactions, and operations. The goal is to achieve sustainable, quality growth. In 2025, we further embedded our quality-first approach into all management systems and business activities. Guided by our quality goals, we continue to hone our competitive edge by bringing quality to new heights.

Cyber security and privacy protection are the cornerstones of the digital and intelligent world. Huawei provides secure and trustworthy ICT infrastructure and smart devices. We have the right capabilities, embrace open collaboration, and are a responsible

Contents

participant in the digital ecosystem, prioritizing our commitment to cyber security over all commercial interests. We have continued to build up our comprehensive cyber security governance system, while embedding cyber security requirements into all aspects of our business processes. We also work closely with our partners to provide secure and trustworthy products, solutions, and services that help customers enhance their network resilience. We actively contribute to cyber security standards and work closely with all stakeholders to build a secure and trustworthy cyberspace.

Building thriving ecosystems for a shared future

Open and thriving ecosystems are at the heart of innovation in technology and applications. Huawei is committed to innovation, open source, and open systems. We work closely with ecosystem partners, developers, universities, and open-source communities to build dynamic industry ecosystems and provide new options for the intelligent world to come.

We are redoubling efforts to open up our platform capabilities to ecosystem partners in domains like HarmonyOS, Kunpeng, Ascend, and Huawei Cloud. Together, we will continue to provide developers with easy-to-use tools and products, improve developer experience and efficiency, and actively contribute to open-source communities. We are also doing our part to help cultivate outstanding professionals for the ICT industry. These efforts include providing basic digital skill training to local communities, as well as holding various competitions and innovation-oriented events.

Promoting sustainable development through digital inclusion

We believe that innovation is a key driver of sustainable development. Building on innovative ICT solutions, we proactively include environmental protection requirements into our products and solutions. We are also working with partners up and down the value chain to further advance energy conservation and emissions reduction, promote renewable energy, and contribute to a circular economy. These are part of our broader efforts to maximize the value of digital technology in powering green development.

We do our best to give back and hope to make the intelligent world a more inclusive and sustainable place. We are making this happen by unleashing the value of digital technology in four high-impact domains: education, environment, health, and development.

Message from the Rotating Chairwoman

We've made it far. The dust has yet to settle, but it's time we press on.

In 2025, the entire team at Huawei stayed anchored to our goals, tackling critical challenges to round off the year with CNY880.9 billion in revenue.

Our connectivity business weathered the impact of industry investment cycles, while our computing business continued to seize opportunities in AI. Our consumer business worked to overcome formidable challenges, driving the HarmonyOS ecosystem to cross a new threshold in user experience. Our digital power business continued to place quality before all else. Huawei Cloud honed its competitiveness with a focus on core services, and our intelligent automotive solutions grew rapidly.

I would like to thank our customers for your ongoing trust and support. And thanks to consumers for choosing Huawei. Your recognition and candid feedback are our driving force. I would also like to thank suppliers, partners, and developers around the world for choosing to work with us. We're pushing forward together, with flourishing ecosystems on the horizon.

I would also like to thank every Huawei employee for your hard work. You overcame all manner of difficulties with tenacity, created value with your expertise, and kept each other motivated along the way.

And, of course, we can't forget your loved ones. Our thanks to your families for their steadfast support. They are our rocks, our source of strength.

Through seasons of cold, we've secured the harvest. When we come together, we can set the world alight.

I. Maintaining strategic focus and honing our competitive edge

AI might just be the last major technological revolution in human history – a journey that will unfold on a magnificent scale, with both ups and downs along the way. We believe that this will be the biggest development opportunity over the next decade – even beyond – and also the most promising strategic opportunity. Our relentless efforts over the past 30 years, along with the groundwork we've laid, have positioned us to make the most of what may be the greatest technological revolution in history.

Of course, the macro environment remains challenging, with uncertainty still on the rise. In foggy waters, a precise compass matters more than speed. While pursuing definite opportunities, it's also critical that we maintain strategic focus. We must stay committed to our strategy, proceed steadily, and prioritize hardware as our main revenue source. We need to control the boundaries of our development, hone our competitive edge, and build a solid foundation – "fertile, silicon-based soil".

Technology develops in a linear way, but demand doesn't. So we need to discard linear thinking, make strategic trade-offs, and build strength in domains where we have competitive advantages.

In the connectivity business, we are integrating AI and security into our products and networks to hone our competitive edge. We are moving ahead with our Water Strategy, increasing the flow of traffic in pipes (wireless and fixed networks) with our Tianshui and Dishui plans. We also keep reshaping and evolving network architecture to adapt to new patterns of data traffic and user demand.

In the computing business, we are building our strength in large-scale computing with clusters and SuperPoDs, especially when it comes to overall computing power, utilization, and system reliability. We continue to push the boundaries of massive compute for training and centralized inference. At the same time, we continue to drive the broad adoption of Kunpeng and Ascend by opening up access to our motherboards and modules, and by enabling partners as we develop a series of enterprise edge products.

In the consumer business, our focus is on strengthening competitiveness with quality products and delivering a leading AI experience across all scenarios. Through large-scale shipments of HarmonyOS-powered devices, we are driving the rapid development of the electronics industry in China.

We will continue to build up our Celia and HUAWEI ADS agents. Through the industry agent enablement platform on Huawei Cloud, we will help spur the development of agents for different industries.

Anchored in mathematical logic, we will increase investment in focused research and innovation to hone the competitive edge of our core businesses.

In bad times, we build strength to grow; in good times, we grow to build strength. Moving forward, we need to make strategic trade-offs and grow together with the vanguards of our times. By subtracting we can multiply – by pulling back, we can focus our strength and act more decisively when the time comes.

II. Translating strategy to execution, and securing small wins for bigger wins

Strategic thinking is only useful when it's translated into practice and proven in the field.

In the consumer business domain, on-device AI is triggering a profound technological revolution. Device makers and AI model developers around the world are competing for control over key points of entry to

hardware, agent, and broader multi-device ecosystems. We will remain focused on consumers, striving to deliver a leading experience with HarmonyOS and Celia.

Internet companies are the primary investors in computing infrastructure, and they represent the leading edge of demand. We will keep iterating our products and restructuring our organization and operating models to meet this demand.

In broader government and enterprise business domains, digital and intelligent transformation has gone beyond improving efficiency and is now a strategic lifeline. Both our technology and industry experts will keep delving deeper into industrial scenarios. With our broad portfolio and joint innovation, we will help our customers overcome the practical challenges unique to their industry. And together, we will keep driving breakthroughs in digital and intelligent transformation.

Over the next few years, capital expenditures in the global carrier market will remain broadly stable. We will respond pragmatically to industry cycles and keep optimizing our presence to help customers succeed.

Success is the result of consistent effort. Translating strategy to execution means applying the complete portfolio of technologies and capabilities that we have built up over the years to secure one small win after another. Gradually, we can build momentum and turn small wins into bigger wins.

III. Going open source and open system to build flourishing ecosystems

A flourishing ecosystem is critical for industry development. The HarmonyOS, Kunpeng, Ascend, and Huawei Cloud ecosystems are growing more robust by the day.

As of the end of 2025, there were more than 10 million HarmonyOS developers across the globe, the HarmonyOS ecosystem began to reach critical mass, and more than 36 million devices ran on HarmonyOS 5 and above.

Kunpeng brought together more than 6,800 partners and 3.8 million developers. Ascend attracted more than 3,000 partners and 4 million developers. And more than 10 million Huawei Cloud developers worked side-by-side with Huawei to make AI technology more accessible, helping our customers overcome a wide range of industry-specific challenges.

We are committed to going open source and open system, and collaborating for shared success. We will continue to increase strategic investment in ecosystem development. We are well aware that an ecosystem begins and ends with developers. Only when developers and partners succeed will Huawei have the opportunity to survive and thrive in the ecosystem. We will keep making our development platforms and tools more useful, user-friendly, and enjoyable to use. This is our goal, and the focus of our strategic investment.

The road to success is right beneath our feet.

In 2026, Huawei will continue to build stronger foundational ecosystems.

For the HarmonyOS ecosystem, we will remain focused on consumer needs as we keep cultivating the developer ecosystem. We will increase investments in tools, build a stronger technical service platform, and establish more robust developer service systems. We will join hands with developers and partners to unleash the full potential of HarmonyOS, and keep driving its experience beyond user-friendly – making it a truly enjoyable system to use. Ultimately, we want to provide consumers with a better option, more possibilities, and an unparalleled, seamless experience across all scenarios.

For the computing ecosystem, we will continue going open source and open system with Ascend. We will keep building out the ecosystem together, to improve its performance and ease of use, and to help our partners and developers drive innovation in AI applications. For Kunpeng, partners remain our priority, and we will keep embracing openness for shared success. We will provide a complete set of migration toolchains and specialized performance-tuning suites to help our partners achieve commercial deployment at scale.

Huawei Cloud will continue to improve developer experience for cloud services, including ModelArts, AgentArts, DataArts, and CodeArts. By introducing more third-party models and applications, Huawei Cloud is working with more than 10 million developers to build an Industry AI Foundry.

When the smallest sparks come together, they grow into a roaring flame. At Huawei, we are committed to cultivating robust industry ecosystems. With innovation as our plow, we will dig deep and grow with our partners to form a landscape where everyone can truly flourish.

IV. Succeeding through quality

High quality is the cornerstone of Huawei's survival and development. We succeed through quality. And we will keep improving the quality of our products, manufacturing, services, networks, and business operations in our pursuit of end-to-end, high-quality development.

We will continue strengthening quality at the very source – product and system design – to build a competitive edge through rigorous design in the lab.

At the same time, we will continue extending our quality management capabilities to the value chain, and embedding quality requirements throughout all manufacturing processes, to ensure that only the best possible quality leaves the factory floor.

We will continue providing high-quality, efficient, and reliable services to ensure overall service quality and stable network operations.

We will continue to guide business units with more robust operational policies, focusing on revenue with profits and profits with cash flow.

Deeper roots grow taller trees. Only when the roots of quality development go deep can we build a more robust and lasting Huawei.

We are moving toward a future that is full of uncertainty, so we have to remain true to our strategy and maintain strategic focus. We will translate strategy to execution, keep cultivating the developer ecosystem, and pursue high-quality development.

The mountains and rivers stretch far and wide, but a long journey is nothing to fear. Whether the road ahead is shrouded in mist or clear as day, we continue to press on.

Victory won't come to us unless we go to it.

Meng Wanzhou
Rotating Chairwoman

Business Highlights in 2025

Driving ubiquitous connectivity

- In 2025, we worked with carriers and partners around the world to accelerate the business development of 5G-A. By the end of the year, the number of 5G-A users worldwide had exceeded 60 million, and the 5G-A networks delivered by Huawei had continued to offer leading experiences. In addition, our 5G-A solutions have helped numerous industries go digital and intelligent, and have become central to the core production processes in the steel, power grid, mining, manufacturing, and other industries to significantly boost productivity and safety.
- We helped carriers build AI-centric bearer networks, and comprehensively upgrade their backbone and metropolitan area networks to deliver ultra-high bandwidth, ultra-low latency, and carrier-class reliability and security. These networks are enabling quality business development for carriers. We also created innovative upgrades for home broadband services, helping more than 50 carriers release fiber to the room (FTTR) packages that can fully empower smart homes. By the end of 2025, the number of gigabit users around the world exceeded 450 million.
- Our Rural series network solutions continued to broaden network coverage in remote areas around the world, helping carriers efficiently deploy cost-effective mobile networks in Nigeria, Ghana, and many other countries. This has helped connect the unconnected, bridge the digital divide, and inject vital momentum into the pursuit of digital inclusion.

Enabling pervasive intelligence

- In 2025, we continued advancing our All Intelligence Strategy. To accelerate industrial intelligence, we have stayed innovation-driven and continued to go open source and open system, while teaming up with customers,

partners, and developers to create a solid computing foundation and provide the world with a new option. Our 384-NPU SuperPoD has been deployed at scale in industries like Internet, finance, telecommunications, and electric power, building a solid foundation for computing. The Kunpeng and Ascend ecosystems have continued to grow steadily, and now have more than 3.8 million Kunpeng developers and 4 million Ascend developers. We have worked with over 9,800 partners to jointly incubate more than 26,000 industry solutions. In addition, we have gone open source and open system with the application enablement kit Kunpeng BoostKit and the Ascend CANN and Mind series software, helping users make the most of Kunpeng and Ascend computing power and accelerate innovation.

- Huawei Cloud has been used in more than 500 scenarios in over 30 industries, including public services, steel, manufacturing, railways, finance, and meteorology. It is helping these industries go intelligent, while unleashing digital and intelligent productivity and empowering innovation across industries.
- In the intelligent automotive solution domain, we have used AI to make new automotive components more intelligent. HUAWEI ADS, HarmonySpace, and HUAWEI Vehicle Control all continued to deliver superior experiences to both drivers and passengers, and the HUAWEI Automotive Optics and HUAWEI Intelligent Vehicle Cloud Service (IVCS) businesses developed rapidly. Over the course of the year, we shipped more than 38 million intelligent automotive components. We also continued to work with more than 600 partners along the value chain to drive the high-quality development of the intelligent automotive industry.
- In the age of AI, we launched our all-scenario "PV + ESS" solutions and used grid-forming technologies to accelerate the adoption of PV, wind, and ESS as main energy sources. We also used AI to start automating PV, wind, and ESS plants. In addition, we worked with partners to build AI data centers that are reliable, agile, and sustainable to maximize tokens per watt.

Delivering a personalized experience

- Huawei's Consumer BG continued to focus on both technological innovation and user experience, enhancing its presence in the smartphone domain, as well as in five key scenarios: HarmonyOS Office, Fitness & Health, HarmonyOS Smart Home, HIMA-powered Smart Travel, and Entertainment. This has allowed us to deliver neat, smooth, seamless, secure, and reliable interaction experiences to users across all scenarios.
- In the smartphone domain, the HUAWEI Pura X widescreen foldable phone and the HUAWEI Mate 80 Series delivered innovative designs combined with premium experiences, receiving high acclaim from the market and consumers. In the PC domain, the HUAWEI MateBook Fold, the world's first foldable PC powered by HarmonyOS, set a new benchmark for ultra-high-end laptops. In the tablet domain, the compact HUAWEI MatePad Mini blended a slim profile and portability with a more intelligent experience, providing users with more options for a product that suits their needs. In the wearable domain, our extensive product portfolio continued to deliver an accurate and comprehensive fitness and health management experience.
- The HarmonyOS ecosystem has gradually become fertile ground for redefining experience. By the end of 2025, more than 36 million devices ran on HarmonyOS 5 and HarmonyOS 6, more than 10 million developers had registered with the HarmonyOS ecosystem, and the number of apps and services available in AppGallery exceeded 350,000.
- We have worked in both retail and services to improve user experience. By the end of 2025, Huawei had 16 Flagship Stores around the world and 480 large Smart Life Stores. Our global service network consists of more than 3,100 Huawei Authorized Service Centers covering 70 countries and regions, and carried out over 100 million interactions with consumers in 2025, making services readily available to consumers.

Building a digital platform

- Huawei Cloud is focused on cultivating fertile soil for computing and accelerating the adoption of AI to tackle industry challenges. By the end of 2025, Huawei Cloud had covered 34 geographical Regions and 101 availability zones (AZs), providing quality cloud services to customers in more than 170 countries and regions.
- Huawei Cloud has built the CloudMatrix AI Infra, which features efficient utilization, openness, ease of use, and high availability. We also launched the AI Cluster Service (AICS) to provide abundant computing resource pools on the cloud. By the end of 2025, the number of customers worldwide using Huawei Cloud AICS had exceeded 1,800.
- Huawei Cloud remains committed to building an ecosystem that is created and fostered by all to benefit everyone in it. This ecosystem aims to accelerate the aggregation of industry applications and empower developers and partners around the world. By the end of 2025, Huawei Cloud had attracted more than 10 million developers and 59,000 partners from across the globe to jointly build an open global ecosystem that thrives on shared success.

Five-Year Financial Highlights

	2025		2024	2023	2022	2021

Openness and innovation: Building AI ecosystems for a shared digital and intelligent future

In 2025, everyone at Huawei stepped up to the plate as we rose to tackle a wide range of challenges. Our overall performance was in line with forecast. We achieved our business goals, laying a solid foundation for the company's sustainable development. I'd like to thank our customers, partners, consumers, and friends from all over the world for your ongoing trust and support.

Over the past year, we further honed our competitive edge while maintaining strategic focus. We stayed on the path of high-quality development, with a firm commitment to succeeding through quality. We worked hard to provide competitive products and services for customers around the world.

Our connectivity business maintained steady operations while building strategic depth. Our computing business grew rapidly, seizing opportunities in AI. Our consumer business's performance was in line with forecast, with the HarmonyOS ecosystem crossing a new threshold in user experience. Huawei Cloud continued cultivating fertile soil for computing, with a focus on core services. Our digital power business continued to prioritize quality and develop core products. Our intelligent automotive solution business grew rapidly, elevating both driving safety and user experience. All the while, we have worked hard to drive digital inclusion and promote green and sustainable development around the world.

Moving forward, we will continue to ramp up R&D investment in strategic domains like connectivity, computing, cloud, devices, intelligent driving, and AI. We aim to hone our competitive edge by integrating AI and security into our products and networks, and build industry ecosystems around Ascend, Kunpeng, and HarmonyOS that thrive on collaboration and shared success. Through openness, innovation, and a quality-first approach, we will keep creating value for our customers, partners, and society as we work to achieve steady, long-term growth.

Strengthening digital and intelligent infrastructure for sustainable AI development

We are in an era of profound technological change. Rapid advances in AI are speeding up the convergence of the digital and physical worlds. This is reshaping how we develop and produce, deliver services, and interact with machines, opening the doors to many new applications. Past industrial revolutions relied on breakthroughs in a single technology. But the AI revolution is different. In this day and age, AI technologies, infrastructure, and application scenarios will reinforce each other and evolve together. AI will be the engine of the intelligent world, but to truly gain traction it needs to be applied to real-world scenarios. Infrastructure will be the foundation of innovation.

At Huawei, we are enhancing the competitiveness of our network products and solutions to provide a guaranteed experience that meets disparate demands for connectivity among people, homes, vehicles, machines, and industries.

5G and 5G-A networks are seeing large-scale commercial rollout, supporting new demands brought about by the rise of mobile AI applications, like multimodal data exchange between devices and the cloud, real-time collaboration, and intelligent decision making. With gigabit and 10-gigabit fiber access, smart homes and campuses are becoming a reality. High-capacity and low-latency communications networks that deliver a premium experience are becoming the cornerstone for the intelligent world. As next-gen computing networks take shape, networking is also vital for seamless data center interconnectivity, as well as providing deterministic, millisecond-level access to computing resources. This combination will allow enterprises to efficiently access and schedule computing power on demand, bringing new levels of intelligence to all industries.

At Huawei, we have been innovating nonstop in foundational technologies and system architectures. This has resulted in groundbreaking innovations like UnifiedBus, a new interconnect for SuperPoDs. We are also developing a series of products and solutions like clusters, SuperPoDs, appliances, modules, and cards for different AI training and inference scenarios. With these efforts, we aim to provide an answer to rapidly-

growing demand for computing power. Through open hardware, open-source software, and partner enablement, we are working to make computing power a new driver of digital productivity, giving all industries a boost on their digital and intelligent transformation.

Huawei Cloud remains strategically focused, investing heavily in AI and computing power, as we work to address the diverse needs of customers, partners, and developers, and bring leading AI services to the market. With our secure, stable, and high-quality cloud services, we aim to create greater value for customers and partners around the world.

Promoting innovation, open source, and open systems to build industry ecosystems that thrive on collaboration and shared success

We are committed to innovation, open source, and open systems as we work with industry partners and developers to build open ecosystems for HarmonyOS, openEuler, Ascend, and Kunpeng. Together, we aim to build a more solid digital foundation for the world and stimulate innovation for a better digital and intelligent future.

Ascend and Kunpeng are going fully open source and open system, and both ecosystems are growing steadily.

In the Ascend ecosystem, our Compute Architecture for Neural Networks (CANN) features a layered, decoupled design that supports a wide range of open-source communities and projects. We also keep innovating to make the architecture easier to use for developers. By the end of 2025, the Ascend ecosystem had brought together over 4 million developers. 43 mainstream foundation models had been pre-trained on Ascend, and more than 400 open-source models had been adapted to run on Ascend. Over 350 partners had launched Ascend-based AI appliances, and more than 6,700 solutions had been adopted in different industries.

Kunpeng foundational software is also evolving nonstop. openEuler has seen over 16 million installations, while openGauss has surpassed 5.5 million downloads. More than 20,000 Kunpeng-compatible industry solutions have been incubated and adopted widely in key industries like finance, telecommunications, and Internet.

The HarmonyOS ecosystem has crossed a new threshold in user experience, bringing the OS from usable to user-friendly. By the end of 2025, more than 36 million devices were running on HarmonyOS 5 and HarmonyOS 6, more than 10 million developers had registered with the HarmonyOS ecosystem, and the number of available apps and services exceeded 350,000. OpenHarmony has grown to become the digital foundation of numerous industries. More than 1,300 OpenHarmony-powered software and hardware products have been deployed across industries like finance, electric power, energy, transportation, and communications.

As always, we continue to invest heavily in R&D, with a focus on basic research, breakthroughs in key technologies, and product innovation to hone our competitive edge. We believe that ecosystems thrive on openness and joint value creation. Technology ecosystems boost industry development, while industry ecosystems drive further innovation in technology. Our goal is to build up industry ecosystems where every participant creates and shares value, and succeeds together.

Maximizing the value of AI: Innovating for real-world application

At Huawei, we fully embrace the potential of AI. We are committed to building a solid AI computing foundation for the world. We continue to invest in our foundation models, as well as Celia and HUAWEI ADS agents. With a sharp focus on key industries and scenarios, we are building up an industry agent enablement platform and jointly innovating with partners. Together, we identify the right technologies for the right scenarios to help industries go intelligent. Internally, we actively apply AI throughout the company to strengthen competitiveness in all business domains.

We are working with carriers and partners the world over to build future-oriented 5G-A and F5G-A networks. By making full use of AI, we are speeding up service innovation and network upgrades while enhancing O&M efficiency, helping carriers build more resilient networks and improve monetization capabilities. In the Middle East, we helped carriers launch AI New Calling services that support simultaneous Arabic-English interpretation during calls. In Asia Pacific, we worked with carriers to implement an agent-powered fault management solution that can pinpoint the root cause of faults in minutes and boost diagnostic automation from about 60% to 90%.

We also published a replicable pathway to industry intelligence based on in-depth experience working with customers across the globe. Alongside our customers and partners, we also released global showcases for industry intelligence in electric power, manufacturing, retail, finance, transportation, and more, providing a series of best practices that can help speed up transformation. In China, we helped a customer deploy the world's first fleet of autonomous, 5G-A-powered electric trucks for open-pit mines. This increased the overall transportation efficiency of each truck by over 20% relative to manual operations. In addition, the trucks work nonstop, even in environments as cold as -40°C, showing how technology can bring production safety to entirely new heights.

As for intelligent automotive solutions, we have been using AI to make new automotive components more intelligent. We are now working with more than 600 partners along the value chain to promote technology enablement and ecosystem development. Through innovative collaboration models, we aim to promote high-quality development in the intelligent automotive industry. In the meantime, we continue to increase our R&D investment in intelligent driving, and to improve driving safety and user experience with technologies like multi-sensor fusion perception, high-performance computing platforms, and full-stack proprietary algorithms. By the end of 2025, HUAWEI ADS-powered vehicles drove a total of over 7 billion kilometers with assisted driving. HUAWEI ADS assisted parking had been used 440 million times, and autonomous parking-to-parking more than 30 million times.

Powering digital, intelligent, and green development through innovation

AI applications are expanding across industries, driving up demand for computing power. As a result, electricity consumption in data centers is surging. Going green is the clear way forward for the entire industry.

At Huawei, we are pushing the limits of technology to improve the energy efficiency of our products and solutions. We are building up reliable, agile, and sustainable AI data centers, while driving clean power development and helping digitalize the energy sector. These efforts are aimed at driving greener practices across sectors and promoting coordinated progress in green, low-carbon, digital, and intelligent transformation.

Huawei Cloud's Wuhu Data Center uses liquid cooling technology to bring its annual power usage effectiveness down to 1.1. This reduces electricity consumption by nearly 1 billion kWh annually per every million servers.

We also helped a carrier in the Middle East to build "zero-carbon" sites in the desert by replacing diesel generators with solar power.

Promoting sustainable development through digital inclusion

Ubiquitous and inclusive connectivity is the foundation for the sustainable development of digital economies. According to the ITU, around 25% of the global population were still offline in 2025, and only 58% of rural populations used the Internet. Huawei is committed to connecting the unconnected, helping people in underserved communities connect with the world.

By the end of 2025, we have worked with carriers to bring connectivity to more than 170 million people in rural and remote areas across over 80 countries and regions.

With Huawei's new RuralCow solution, people in remote villages in Nigeria now have the opportunity to access financial services and online education.

In Jamaica, we helped carriers restore sites to ensure smooth communications for disaster relief efforts and local communities in the aftermath of a hurricane.

In addition to connectivity, we are working to bring the benefits of digital technology to everyone through a series of digital inclusion initiatives. HarmonyOS's Celia World View uses AI-powered multimodal recognition to help people with visual impairments identify objects, navigate, and read using their smartphone cameras. In the consumer business, we provide video-based services using sign language for people with hearing impairments, a service used by more than 62,000 people to date.

Enhancing corporate governance and ensuring operational compliance to better serve our customers

A robust corporate governance system is the cornerstone of sustainable development. In 2025, Huawei's Representatives' Commission held one meeting where they reviewed and approved the annual work report of the Board of Directors, the Supervisory

Board's review report on the Board of Directors' annual responsibility fulfillment, the Supervisory Board's annual work report, proposals for annual profit distribution and annual capital increases, and others.

In 2025, our Board of Directors held 13 meetings where they reviewed and decided on matters such as the company's medium-to-long-term strategic plan, annual business plan, audit report as well as proposals for profit distribution and capital increases.

We are committed to operational compliance and business ethics. Complying with applicable laws and regulations is one of our core principles. We keep evolving and improving our compliance management system that covers trade compliance, financial compliance, anti-bribery compliance, intellectual property and trade secret protection, and cyber security and privacy protection. These compliance requirements have been embedded into our policies, regulations, and business processes to ensure our long-term sustainable development. We work hard to create a culture of integrity, and require all employees to comply with our *Business Conduct Guidelines* (BCGs).

The global environment is changing rapidly these days, and intelligent transformation continues to gain depth, presenting both opportunities and challenges. As always, we will maintain strategic focus and keep honing our competitive edge as we seize new opportunities presented by digital, intelligent, and low-carbon development. We will continue working hard to provide better products and services to our customers, and bring digital to every person, home and organization for a fully connected, intelligent world.

Liang Hua
Chairman of the Board

Industry Trends

An age of All Intelligence is arriving – and fast

The global macro environment remains rife with challenges these days. Factors like geopolitical conflict, deglobalization, and economic downturn cast mounting uncertainty on where the world is heading. But one thing is clear: AI will be the most promising strategic opportunity in the coming decade and beyond. More and more countries and regions are rolling out critical digital and intelligent infrastructure, and a growing number of companies are ramping up to make the most of it.

AI is becoming a major engine for productivity and industry transformation. New developments are virtually everywhere: not just the training of AI models, but the sheer prevalence of inference; not just one-off model calls, but long-horizon execution and multi-round collaboration; not just content generation, but the autonomous execution of complex tasks; not just greater coding efficiency, but new approaches to R&D; not just digital intelligence, but physical AI that can work in real-world settings.

Agents are becoming more tightly woven into the fabric of individual, home, and industrial scenarios, spawning a wealth of new businesses and opportunities.

- **For individuals:** Agents have become an integral part of mobile applications, bringing a host of new

experiences, such as multimodal interactivity, real-time concurrency, and multi-agent collaboration. To deliver these intelligent experiences across scenarios, personal devices (e.g., AI-powered mobile phones, tablets, and wearables) need to evolve, and networks need massive improvements in latency, reliability, security, and bandwidth (both uplink and downlink).

- **For homes:** The growing use of agents in home terminals is empowering a new digital lifestyle, allowing services to flow naturally as users switch between devices or move from one room to another. Underpinning this type of experience are all-optical networks, which are making their ways into more homes.
- **For industries:** Agents are increasingly used in core organizational processes, such as R&D, supply chain, manufacturing, marketing, and customer service. To unlock the full value of these agents, powerful connectivity and elastic computing are key – both of which rely on nonstop advancement in digital and intelligent infrastructure.

These signs point to the imminent arrival of an age of All Intelligence, one where agents are deployed at scale, benefitting all industries, and demand for tokens grows exponentially.

Digital and intelligent infrastructure and devices are going AI-native

Connectivity: Converging AI and networks for intelligent connectivity

The agentic Internet is coming. Personal agents are spreading out to more aspects of daily life, and smart homes are more and more common. At the same time, more in-depth integration of AI into industrial scenarios is realizing the full value of intelligence. Networks are a major driving force behind these trends, delivering AI services wherever and whenever they are needed. Networks of all types – from mobile

and fixed to computing networks (with DCs at their core) – continue to evolve, with agents that bring network performance, security, and O&M efficiency to entirely new levels.

The convergence of 5G-A and AI is key to unleashing the full potential of connectivity. At present, as 5G-A enters large-scale commercial deployment, many carriers are upgrading their networks for continuous

coverage and driving the evolution of all services, devices, and spectrum bands towards 5G-A. Moving forward, carriers will also harness the upper 6 GHz band and more advanced AI to further boost spectral efficiency and air interface performance. On the business end, many carriers are actively exploring new ways to monetize 5G-A's experience, and some are bringing user experience to new heights with AI-powered innovations like new calling and cloud phones.

Home and campus networks are upgrading from 1 Gbps to 10 Gbps. In homes, demand for new smart applications (e.g., AI-powered home management) is spurring the home broadband sector to make 10 Gbps connectivity a reality. For enterprises, intelligent campus networks that can reliably deliver a 10 Gbps experience are the answer to growing demand for AI-powered offices, production, and full-scope security.

In the meantime, the evolution towards DC-centric network architectures is picking up speed. Demand for computing power continues to soar, a trend that is reshaping network traffic patterns. This is driving the adoption of multi-plane network architectures

and higher Ethernet switching bandwidth to enable ultrafast, lossless, secure, and reliable DC networks, which are necessary for efficient compute-network collaboration. Additionally, coordinating and orchestrating computing resources across DCs will become a more common necessity, calling for nonstop evolution in DC interconnect and DC access technologies, alongside greater efforts to build different latency circles for computing networks (1 ms, 5 ms, and 20 ms).

Autonomous networks (ANs) are moving beyond single-domain autonomy towards cross-domain collaboration, and the importance of these networks is rapidly gaining recognition throughout the industry. More and more carriers are launching AN Level 4 strategies in a bid to build autonomous networks powered by agentic AI. These networks will achieve single-domain autonomy in high-value scenarios, while using network agents that work together to fix cross-domain faults and deliver the services required. The results will be immense, including greater O&M efficiency, superior user experience, and the ability to tackle network issues faster.

Computing infrastructure: Laying a solid foundation to speed up industrial intelligence

AI services are growing more affordable over time, while inference calls are increasing in frequency. At the same time, agent collaboration is pushing up demand for computing. Against this backdrop, while centralized training and inference remain dominant, compute is increasingly distributed across DCs, edge, and devices. This means computing infrastructure needs to be able to deliver DC-scale computing and bring computing to the edge – close to where services are required. This ability is hinged on a unified architecture and well-coordinated scheduling, which will help drive stable, larger-scale AI application in more scenarios.

Innovation in high-performance computing systems like SuperPoDs and SuperClusters is picking up pace, unleashing incredible computing potential. SuperPoDs are becoming the new norm for AI infrastructure, and leading companies are breaking new ground in multiple domains. They are creating novel bus architectures for SuperPoDs, and pushing the limits of basic components, protocol algorithms, and optical-electrical integration to maximize computing power. Leading players are also working on systems integration and full-stack optimization across computing, networking, and data storage. Single clusters have grown to house hundreds, thousands, and even tens of thousands of processors. What comes

next are SuperPoDs and SuperClusters that deliver even higher computing resource utilization, support for more data formats, and lower communications latency – all features that are vital to meet more demanding requirements like training trillion-parameter models and conducting inference in million-token contexts.

SuperPoDs and SuperClusters will require AI DCs that can cope with the rising power density of these computing systems, as well as their growing demand for electricity, cooling, and energy efficiency. Liquid cooling has become the standard for AI DCs. In key areas like material technology, core components, and manufacturing processes, leading companies are plugging away at hardware engineering bottlenecks that hamper electricity supply, cooling, and interconnect. Beyond that, it takes forward-looking planning to build AI DCs with infrastructure capable of elastic electricity supply, cooling, and deployment.

As industries move forward with their intelligent transformation, there is growing demand for AI appliances. And widespread adoption of industry agents is stimulating computing demand for inference. Serialized AI appliances – both large and small – come with everything pre-integrated, from hardware and software to models and applications. These appliances

stand out for their out-of-the-box performance, private deployments, and data security, and are quickly becoming a go-to offering for industrial intelligence.

A flourishing computing ecosystem is also necessary for driving industrial intelligence forward. Anchored in foundational AI software and hardware platforms, the

ecosystem provides serialized hardware modules, along with a rich variety of toolchains, acceleration libraries, and development kits. These products and tools will deliver improved performance, ease of use, and development efficiency – equipping ecosystem partners and developers with what they need to bridge the last mile of AI implementation.

Cloud: Shifting to an agent-centric paradigm and empowering industries with agile innovation

AI is supercharging innovation across industries. As the cloud computing sector transitions from a model-centric approach to a more agent-centric paradigm, evolution is unfolding fast across the capability stack, ranging from AI infrastructure and models to agent development platforms and industry agents. A token economy is surfacing, where a broad push to monetize tokens is revealing the best possible ways that AI players can recoup their investment, all while prompting them to probe new frontiers.

Several notable trends are taking shape:

First, agents are making massive inroads in high-frequency business workflows. Coding agents can integrate a company's R&D knowledge base across domains, and when embedded in an integrated development environment (IDE), they can greatly enhance coding efficiency. Office agents are an efficiency catalyst across the board, providing out-of-the-box skills, shared cross-departmental memory and knowledge bases, and centralized management capabilities.

Second, industry agents are set to see more widespread application. Cloud-based agent development platforms combine hybrid low-code and pro-code development, enterprise-grade O&M capabilities, and unified agent asset libraries to lower barriers to development and improve the overall developer experience. At the same time, fully asynchronous reinforcement learning has made training industry-specific models more efficient than ever. Companies eager to use AI can work with cloud service providers to build their own industry agent enablement frameworks, tools, and development environments.

Third, token services have become the primary way for many companies to make the most of AI models. Intense competition in the model market has given rise to a slew of new tech breakthroughs and use cases, and has caused the cost of model usage to drop rapidly. The process from tech research to massive adoption is picking up speed.

Companies seeking to create industry agents tailored to their own challenges need the flexibility to use multiple models based on the scenario at hand. That's where cloud service providers come into play: They can deliver tiered, cost-effective token services that make use of proprietary models, state-of-the-art third-party models, enhanced post-training (crucial for scenario-specific models), and co-optimization of software and hardware.

Fourth, efficient AI infrastructure services are the keystone of nonstop advancement in AI. These services deliver new capabilities at the resource, scheduling, and engine layers:

- The ability to pool and flexibly mix different generations of computing resources makes it possible to manage disparate resources more efficiently.
- The ability to holistically and intelligently schedule all parts of AI infrastructure – from AI computing and general-purpose computing to data storage and networking – unleashes the full horsepower of the entire system.
- Native multimodal engines and encode-prefill-decode (EPD) disaggregation allow for optimized load balancing, which is essential for concurrent generation of vast quantities of tokens.

Smart devices: Upgrading cross-scenario experience with new form factors and unified agents

As we move into the AI era, we will see a richer array of form factors for smart personal devices. For

instance, AI-powered wearables and home terminals will offer seamless services around the clock through

more natural forms of interaction. For homes and individual users, we will see a rise in embodied AI robots and service-oriented devices that provide better companionship and day-to-day services. These new devices will work with and complement smartphones, cockpits, tablets, PCs, and the like. This kind of cross-device synergy will go beyond functional interoperability, providing a more cohesive experience as users switch from one device to another.

As agents continue to evolve fast, there will be a drastic change in how users interact with on-device AI and how they use AI services. Instead of simply responding to user instructions, AI-powered devices will be able to anticipate user intent and offer services accordingly. Occasional use of AI will gradually give way to greater reliance on – and regular use of – AI services as people go about their day. Agents will be the new portal to these types of services, and help orchestrate them.

Apps for the device ecosystem will advance along two paths, depending on how they deal with agents. For efficiency-focused apps, their value will stem in large part from the capabilities that can be orchestrated and called upon by agents. A collaborative relationship

will emerge between these apps and agents in areas like understanding and planning tasks, linking up processes, and delivering services. More experience-focused apps (e.g., video, music, and gaming apps) put a premium on immersive experience and content consumption, so in the foreseeable future their relationship with agents will be one of co-existence and mutual reinforcement.

Cross-device collaboration is the new norm. Against this backdrop, unified agents are essential for delivering a more cohesive intelligent experience across different scenarios. Given authorization by users, with solid mechanisms in place for privacy, security, and trustworthiness, unified agents will be tightly integrated with devices, retain memories of past interactions, and grow to understand their users. The result will be seamless, proactive services across devices. More advanced capabilities, including cross-device context awareness, multimodal interactivity, and device-cloud synergy, will allow users to start on one device and seamlessly pick up where they left off on another device. In a nutshell, agents will provide users with a more intelligent, intuitive, and secure experience in all settings – whether they are working out, having fun, on the go, in the office, or at home.

Intelligent automotive solutions: Shifting gears from electrification to higher-level intelligence

In addition to going electric, the automotive sector has set its sights on higher-level intelligence. AI technology for vehicles is iterating faster than ever, and the shift from AI-assisted driving to autonomous driving is speeding up. Embedded AI in vehicles is making mobility much safer and more enjoyable for drivers and passengers alike. AI is also transforming the automotive sector and its value chain.

AI is vital to onboard sensing, decision making, multimodal interaction, and collaborative control – the attributes that are redefining what vehicles can do and the business models around them.

Bolstered by state-of-the-art algorithms and models, AI-assisted driving systems will begin to self-evolve and acquire more advanced sensing and complex decision-making capabilities. This will give human drivers a greater sense of safety when their hands are on the wheel, offer them peace of mind when assisted driving is on, and make parking less of a pain. For the automotive sector, software subscriptions are becoming a predominant business model.

Multimodal models are increasingly used in cockpits, changing how users interact with onboard systems. Instead of simply waiting for instructions and then responding, AI-powered cockpits can perceive user intent and deliver exactly what they need, right when they need it. Cockpits like these are becoming an intelligent mobile space where all devices can connect seamlessly for a smooth, holistic experience.

In vehicle controls, computing and communications architectures are maturing by the day, making software-hardware decoupling and cross-domain collaboration possible. Software-defined vehicles continue to gain traction.

On the road to greater intelligence, vehicle safety, security, and quality remain non-negotiable fundamentals – and the preconditions for user trust and scaled implementation of higher-level intelligent solutions.

Digital power: Upgrading to next-generation energy infrastructure for an intelligent world

Next-generation energy infrastructure is evolving fast in three key areas – power systems, transportation, and digital industries – and is underpinned by high standards for quality, safety, and reliability.

With ongoing advancements in new energy infrastructure, power systems can operate with greater safety and stability, while producing lower carbon emissions. Broader rollout of new energy infrastructure for transportation is accelerating the shift towards electrified, green mobility. And in digital industries, new energy infrastructure is driving down energy consumption per bit, laying the groundwork for a high-efficiency, green, and sustainable future.

Grid-forming technology makes it possible for solar power, wind power, and energy storage systems to work together more stably in all stages of the electricity sector – from generation and transmission to distribution and consumption. Grid-forming has proven essential to the rise of renewables as main sources of energy. On the generation side, the grid-forming energy storage system (ESS) implements virtual inertia support, short-circuit current support, and wideband oscillation damping to improve the grid's ability to readily integrate new energy sources and keep the output stable. When it comes to electricity transmission and distribution, grid-forming ESS is highly responsive to frequency regulation and adjustable to varied working conditions – two capabilities crucial to power grid safety and stability. On the consumption side, grid-forming ESS is capable of black starts and flexible on-grid and off-grid switching, making power grids safer, more resilient, and more accommodating to new energy sources.

New energy infrastructure for transportation is being deployed faster than ever. High-voltage fast and ultra-fast charging technologies, along with intelligent power systems for new energy vehicles (NEVs), are boosting electrification in transportation. Meanwhile, the value chain for fast and ultra-fast charging is maturing, making it possible for electric passenger vehicles and heavy-duty trucks to charge up quickly. Not only are vehicles getting more range per charge, but the charging experience itself is vastly improved.

In the meantime, advances in coordinated control between intelligent driving systems and power domains, along with AI-driven decision optimization and distributed architectures, are enhancing vehicle safety and range. Integration of PV, ESS, and chargers, as well as greater synergy between vehicles, chargers, and power grids, are giving NEVs ready access to electricity from new energy sources. Put together, these trends are paving the way for fully electric, green mobility.

As AI begins to see large-scale deployment, both training AI systems and running them require a massive amount of electricity that is reliable, safe, stable, economical, and green. AI DCs in particular face a host of challenges, including access to electricity, high-density power supply and cooling, as well as the ability to use green energy. Tackling these challenges will require significant innovation in end-to-end power supply – from grids to chips – along with advanced cooling architecture, integrated generation-grid-load-storage systems, direct supply of green energy over dedicated power lines, and advanced energy storage technology.

Openness and collaboration for a better intelligent future

Openness is how we can best navigate change and delve into each wave of digitalization and intelligence. Innovation happens best when we collaborate, because together we can push the envelope of what's possible.

The future will be an intelligent world, one where all things are intelligent and connected, thriving in symbiosis. It's a world where all players need to give full play to their unique roles:

- Customers who define the value of AI applications based on their scenario-specific needs, verify applications in practice, and close the value loop

- Partners who translate industry know-how, engineering capabilities, and ecosystem resources into executable and replicable solutions
- Developers who bring agentic capabilities to real-world scenarios and develop workflows and skills through co-creation

And the list goes on.

Through openness and collaboration, let's build a flourishing ecosystem and move towards a better intelligent future together.

Our Vision, Mission, and Strategy

Huawei's mission is to bring digital to every person, home and organization for a fully connected, intelligent world. To this end, we will:

- Drive ubiquitous connectivity and promote equal access to networks to lay the foundation for the intelligent world
- Provide diversified computing power to deliver ubiquitous cloud and intelligence
- Redefine user experience with AI, offering consumers a more personalized and intelligent experience across all scenarios, including home, travel, office, entertainment, and fitness & health
- Build powerful digital platforms to help all industries and organizations become more agile, efficient, and dynamic

Ubiquitous Connectivity

Every person has the right to be connected. Connectivity is the foundation for social progress and economic growth. Connections will soon become a natural and ubiquitous resource, provided by networks that proactively sense changes and user needs. These networks will offer intelligent, seamless, and secure connections to people and things whenever and wherever they want. With the advent of 5G-A, we begin a new chapter in this story.

Personalized Experience

Using AI, cloud, and big data technologies, enterprises can better understand their customers' needs and innovate with greater agility to craft a more personalized experience. Coordination and collaboration across industries will drive innovation at scale. With the continuous evolution of smart devices, a seamless experience across all scenarios will become the foundation of an intelligent life.

Pervasive Intelligence

In the digital economy, computing power is a new driver of productivity. Data itself is a core asset, and cloud and AI are the new tools of productivity. Moving forward, AI computing will account for more than 80% of a computing center's capacity, providing the muscle for practical AI applications in all areas of life. To deliver ubiquitous cloud and intelligence, we will need to provide diversified computing power.

Digital Platform

A new digital wave is sweeping the globe. Digital and AI technologies are helping all governments and enterprises become more agile, efficient, and dynamic. Open, secure, flexible, and easy-to-use digital platforms are facilitating innovation and transformation in all industries. These digital platforms will be the bedrock and the fertile ground for our digital society to flourish.

Ubiquitous Connectivity

Connectivity has extended from people to things and from our homes to the factory floor. Now, it's the cornerstone of our increasingly intelligent world. Huawei is doing what it can to help our customers get ready for the future.

For mobile and home users, Huawei teams up with carriers to provide an ultra-broadband experience across all aspects of everyday life.

For governments and enterprises, Huawei collaborates with partners to enable digital and intelligent transformation in different industries. We support the diverse needs of customers by providing connectivity solutions defined by ubiquitous ultra-broadband, deterministic experience, and advanced intelligence.

We are working to push connectivity to its limits with leading products and solutions, including our innovative 5G-A × AI solutions, intelligent core networks, Xinghe AI networks, and F5G-A all-optical networks. We are also actively collaborating with the industry to define its next steps and drive the advancement of connectivity. In addition, we are incorporating AI into networks to realize automated O&M, energy conservation, and experience assurance.

As green development becomes the clear path forward for all industries, the compounding forces of digitalization and decarbonization will drive us ever closer to a sustainable future. Huawei works closely with customers and partners on nonstop innovation for new digital and energy infrastructure. We aim to provide green ICT that will enable green development and bring greener connections to all parts of the world.

Pervasive Intelligence

Data has become a valuable raw material, and computing power has become the new driver of productivity. The amount of data we produce will explode as more and more of the devices around us become smart, and more industries will need massive, intelligent storage capabilities to handle these new resources. Abundant and affordable computing power will determine the future of the digital economy.

Through nonstop innovation in data storage, computing, and cloud services, Huawei is helping industries go digital and intelligent by making pervasive intelligence possible. Together, we will build a fully intelligent world.

Huawei is committed to building future-proof data storage power to drive AI implementation across industries. Our data storage offerings are a building block for customers' efficient, green, and trustworthy data infrastructure.

In computing, Huawei has released the UnifiedBus interconnect technology and unveiled SuperPoDs for general-purpose and AI computing. We innovate nonstop in foundational technologies and system architectures, and remain a staunch advocate for open source and open systems. In collaboration with industry partners, Huawei creates a solid computing foundation and provides the world with a new option.

In cloud computing, Huawei Cloud cultivates fertile soil for computing and helps industries use AI to tackle their most challenging issues. Together with developers, Huawei Cloud creates the Industry AI Foundry – an innovation and enablement platform that offers a variety of resources to harness the power of AI in vertical industries.

In terms of intelligent automotive solutions, Huawei remains committed to our strategic position as a provider of new components for vehicles. We provide superior driving and charging experiences by continually iterating our solutions, including HUAWEI ADS, HarmonySpace, HUAWEI Vehicle Control, DriveONE, and liquid-cooled ultra-fast charging. We work with partners along the value chain to provide car OEMs with quality intelligent automotive components that offer premium experiences. Our goal is to bring intelligence to every vehicle.

AI and digital technologies are making power systems more intelligent. This is making new energy safer and more stable, intelligent, and efficient than ever. Through nonstop innovation, Huawei continues to build new energy infrastructure for power systems, new energy infrastructure for electric mobility, and new energy infrastructure for the digital industry. We aim to contribute to a greener, better future by powering the shift towards decarbonization, electrification, digitalization, and intelligence in the energy sector.

Personalized Experience

The physical and digital worlds are converging, and the process is speeding up. Mass production is giving way to mass customization, leading to greater business innovation, closer collaboration across ecosystems, and a richer user experience.

Using new technologies like AI and cloud, enterprises can better understand their customers' needs and innovate with greater agility to craft a more personalized experience. Coordination and collaboration across industries will drive innovation at scale.

In our user-centric intelligent world, usage scenarios and experiences are evolving. The boundaries between products and services continue to break down, with many converging scenarios, including home, travel, office, entertainment, and fitness & health. Content and services are traveling with users for a completely

seamless, holistic experience. Smart collaboration between software and devices are giving users an intelligent experience across all scenarios.

At Huawei, we will continue working closely with partners across our software, service, and hardware ecosystems to both integrate existing technology and drive innovation to better serve consumers. Built upon the unified foundation of HarmonyOS, our consumer business will continue to enhance our presence in the smartphone domain, as well as in five key scenarios: HarmonyOS Office, Fitness & Health, HarmonyOS Smart Home, HIMA-powered Smart Travel, and Entertainment. We will continue to build out the HarmonyOS ecosystem, aiming to deliver an unparalleled intelligent experience to consumers in all real-world scenarios.

Digital Platform

Data volumes are growing exponentially as more and more industries embrace intelligence. Enterprises are applying digital and intelligence to a growing array of scenarios as cutting-edge technologies, innovative models, and intelligent algorithms continue to emerge. All of this is creating a multiplying effect of accelerated innovation.

From video data and industrial data to personal data and consumption data, all data is coming from more sources and in more forms and is becoming more fragmented. Powerful digital platforms are needed to integrate this data.

New technologies in connectivity, cloud, AI, computing, and industry applications are converging to support comprehensive intelligent connections between people, things, and information at multiple levels. These technologies will help industries expand their traditional boundaries, and enable enterprises to expedite intelligent upgrade. Enterprises will have to adapt their strategies, organization, processes, marketing, services, manufacturing, and R&D to cope with changes. To do so, they will need to synergize the cloud, networks, edge, and devices to build an open, powerful digital platform with multidimensional perception, all-domain collaboration, accurate judgment, and continuous evolution. With cloud as

the foundation and AI at its core, this digital platform helps users accumulate industry know-how, rapidly innovate their core business processes, and quickly iterate to respond to changes in their business environments.

A digital platform is one of the core engines that drives success in digital and intelligent transformation. New information technologies can make organizations more efficient through the intelligent management of physical assets like buildings, factories, production lines, and utilities. At the same time, advanced digital technologies in connectivity, cloud, AI, and computing can change the way organizations operate and create new business models. This is the process of digital and intelligent transformation. An organization's IT systems and the corresponding operational methods combine to form a digital platform.

Together with our ecosystem partners, Huawei provides innovative technologies, products, and solutions that help customers build open, secure, flexible, and easy-to-use digital platforms. With our digital platform, Huawei assists customers in crafting their own intelligent solutions, and enables industries to navigate digital transformation and intelligent upgrade. Huawei's digital platform is injecting new momentum into the digital economy.

2025 Business Review

In 2025, we maintained our strategic focus, continued honing our competitive edge, pursued high-quality development, and remained committed to succeeding through quality. We optimized our portfolio to enhance business resilience, and worked to build thriving ecosystems alongside our partners and provide customers worldwide with competitive products and solutions. In 2025, Huawei's annual revenue was CNY880,941 million, an increase of 2.2% year-over-year. Our overall performance remained steady.

By business segment

(CNY Million)	2025	2024	YoY
ICT Infrastructure	375,014	365,424	2.6%
Consumer	344,473	339,006	1.6%
Cloud Computing	32,161	33,325	(3.5)%
Digital Power	77,312	68,607	12.7%
Intelligent Automotive Solution	45,018	26,158	72.1%
Other	6,963	29,552	(76.4)%
Total	880,941	862,072	2.2%

Note: During 2025, our revenue derived from the cloud computing business, including revenue from other Huawei segments, amounted to CNY72,075 million.

By region

(CNY Million)	2025	2024	YoY
China	616,249	615,264	0.2%
EMEA	161,356	148,355	8.8%
Asia Pacific	50,113	43,306	15.7%
Americas	37,184	36,301	2.4%
Other	16,039	18,846	(14.9)%
Total	880,941	862,072	2.2%

- In the Chinese market, as AI was advancing rapidly and industries were accelerating their digital and intelligent transformation, we fully leveraged our strengths across computing, storage, networks, digital power, devices, and intelligent automotive solutions, and introduced a series of products and solutions, including appliances, clusters, and SuperPoDs, to meet the surging demand for compute. We also worked to foster an open Ascend-centric AI ecosystem and intensified efforts to build the HarmonyOS ecosystem. As a result, we met our performance forecast across all business segments. In 2025, our revenue from the Chinese market was CNY616,249 million.
- In Europe, the Middle East, and Africa (EMEA), as digital, intelligent, and low-carbon transformation sped up across industries, our ICT infrastructure business and consumer business recorded growth, our cloud computing business met its performance forecast, and our digital power business grew rapidly. Huawei's revenue from this region was CNY161,356 million in 2025.
- In the Asia-Pacific Region, as 5G deployment accelerated and industries stepped up efforts to go digital, intelligent, and low-carbon, our ICT infrastructure business and cloud computing business posted growth, our digital power business maintained strong growth momentum, and our consumer business grew rapidly in its high-value products. Huawei's revenue from this region was CNY50,113 million in 2025.
- In the Americas, 5G and data communication network deployment picked up speed and industries increased the pace of digital, intelligent, and low-carbon transformation. As a result, our ICT infrastructure business and digital power business remained steady, our cloud computing business grew rapidly, and our consumer business maintained its focus and recorded growth. In 2025, our revenue from this region was CNY37,184 million.
